PRELIMINARY AMENDMENT
U.S. Application No. 09/765,995

REMARKS

The foregoing amendments have been made to correct minor typographical errors in the specification. No new matter has been added. Early, favorable consideration on the merits is respectfully requested.

Respectfully submitted,

PATENT APPLICATION

PRELIMINARY AMENDMENT
U.S. Application No. 09/765,995

APPENDIX

VERSION WITH MARKINGS TO SHOW CHANGES MADE

IN THE SPECIFICATION:

The specification is changed as follows:

Page 6, eighth full paragraph:

Figs. 8 and 8a are diagrams more particularly illustrating the light collecting zones in the arrangements of Figs. 6 and 6a, respectively[.];

Page 11, fourth full paragraph:

Movement controller 13 further controls a two-dimensional scanning stage 22 effective, during the Phase II examination, to position the wafer at any desired position with respect to the Phase II detector 9 (the CCD matrix). As described in detail below, the control of one of the axes of this stage serves also during the Phase I examination. Movement controller 13 further controls a rotation/level/focus stage 23, which rotates the wafer about its axis to align it angularly, to level it, and to keep it in focus during scanning. Stage 23 also [roves] moves the vacuum chuck 24 and its wafer towards or away from the Phase II sensor 9 to enable producing a plurality of images at different depths during the Phase II examination, as will be described more particularly below.

Page 18, the third full paragraph:

The output of Decision Table 66 is applied to a parameters buffer circuit 68 which records the parameters describing each defect, such as the exact coordinates and the type (to be

PRELIMINARY AMENDMENT
U.S. Application No. 09/765,995

explained later) and intensity of the pixels in the immediate vicinity of the defect in both the inspected and reference images. It receives as inputs the alarm flag trigger ("0" indicates no defect, and "1" indicates a defect), and all the parameters to be recorded. The [the] latter are received from temporary memories associated with each of the eight channels. The parameters buffer 68 outputs a list of the defects accompanied by their parameters to the post processor 14.

Page 25, the third full paragraph:

The Ratio Calculator 70e computes the ratio between the current pixel P(ij), and the average of the pixels in the surrounding area in the vertical and horizontal directions. It [If] outputs the following signals: the ratio in the horizontal direction (Rh); the ratio in the vertical direction (Rv); and the ratio to the average of the four surrounding pixels (Rij).

The paragraph bridging pages 35-36:

Multiplier 86 also receives the output from the Summation Calculator 84 via the Division Table 85. Thus, the Summation Calculator 84 computes the absolute sum of the two matrices On which the processing will be carried out. It includes, for each Pixel Normalizer 81, 82. an Absolute Value Circuit 84a, 84b, which computes the [absolutes] absolute values of each normalized pixel; and a Matrix Sum Circuit 84c, 84d, which sums the nine absolute values.

Page 36, the second full paragraph:

Multiplier 86 computes the result of [o] the normalized difference for the point under test. The computation is carried out using the formula:

$$\text{SCORE} = (\Sigma \; |P_I - P_R|) * [1/(\Sigma \; |P_I| - |P_R|)]$$

where P_I, P_R are the normalized values of the pixels.

PRELIMINARY AMENDMENT
U.S. Application No. 09/765,995

The paragraph bridging pages 36 and 37:

The construction and operation of the Defect Detector, as illustrated for example in Fig. 14, will be bettor understood by reference to Figs. 24 and 25. As [describer] described earlier, the function of Comparator 77 is to carry out a comparison between the inspected image in the vicinity of the current pixel, and the reference image in the vicinity of the corresponding pixel, and to output an Alarm signal, via buffer 68 (Fig. 12), to the Post Processor 14 indicating whether or not there is a suspected defect. As also indicated earlier, the comparison is made with respect to a variable threshold level, which is dependent on the Type of the current pixel in the reference and inspected images.

Page 38, the first full paragraph:

Comparator 77 further includes nine conversion tables 77i for the low threshold level, and nine conversion tables 77j for the higher threshold levels. These tables are loaded prior to the inspection session. The tables are selected from a set of tables according to the required sensitivity of the detection, as set by the user. Their function is to [mutliply] multiply each one of the energies around the pixel being examined by a constant which depends both on the type of the examined pixel in the reference image, and the type of the current pixel in the inspected image.

Page 39, the second full paragraph:

The post-processor 14 (Fig. 12) thus receives the list of suspected defects, together with their relevant parameters, and makes decisions before passing them onto the Phase II examination system.[.] These decisions include: (a) clustering; (b) choosing the points which

PRELIMINARY AMENDMENT
U.S. Application No. 09/765,995

will be passed to Phase II; and (c) the optimum route in Phase II. The latter functions are carried

out by microprocessor programs.

Page 49, the second full paragraph:

The information detected by the image converter 309 is fed to a preamplifier 320 in the

preprocessor 310, then to a digitizer 321, and then to a memory buffer 322 in the image

processor 311. The image processor 311 further includes a digital signal processor which, under

software control ([bock] block 324) from the main controller (8, Fig. 2), performs a comparison

operation 327, and a classification operation 328. Since the comparison distance (d) is small for

typical repetitive patterns, it is assumed that the CCD frame contains at least two comparable

units. Therefore, it does not perform a matching operation or a registration operation,

corresponding to operations 123 and 126 in Fig. 27. The output from the digital signal processor

323 is then returned to the main controller.
